

Ghost Leads Scraper

Details Grabbed From Other Scraper:

Fire Crawler - Crawls data or Stub Connectors

Lead Sources:

Reddit!!!

Nextdoor!!!

Facebook Groups

Build:

Backend - Ghost Leads App

- **Display New Leads**
- **Shows promises scrape data**

Phone Call Routing - Twilio

- **We'll comment this phone number on the platform so we can track when new leads call us**

LoggedIn Page Scraper - Deep seek?

- **Constantly keeps tabs on Reddit, Nextdoor and Facebook groups to find new leads instantly**
- **Filters and finds qualified leads based on parameters**

Web browser / Commenter Bot

- **Bot that is logged in and comments when new qualified opportunities arise**

Plumbing

Anyone know of a plumber that can do only the installation a 50 gal electric water heater?

DM sent:

Hey there, just saw your post. I recently had to get a water heater installed too, and these guys were super helpful. I think i still have their number, hold on.

Plumbing

Hello, for my son's house in Purcellville, we require a replacement hot water heater- we would prefer a State ProLine® 74-gallon tall natural gas water heater or something similar • Brand / Line: State ProLine® • Capacity: 74 gallons (75.1 actual) • Fuel: Natural Gas • Input: 75.1 MBH • Type: Atmospheric vent, Low NOx • Model: SGS675XXRS We have Homeserv but they sent a contractor who quoted an absurdly exorbitant rate and we suspect that if we went direct and out of Homeserv with someone honest and reasonable, we can get a better price and also better service. Is there anyone who can help us, as we need this quickly and if people can give us some ball park quotes, it will help us shortlist. Thanks, Regards,... see more

DM sent:

Hey there, just saw your post. I totally get needing a new hot water heater, I had to replace mine not too long ago. these guys helped me out, and they were pretty straightforward. I think i still have their number, hold on.

```

Agent Code:

```
const TRIMEN_VET_SYSTEM = `
```

You are an AI qualifier for Trimen Landscape in Tampa.

ONLY mark a post as GOOD if BOTH are true:

1) It matches Trimen's services:

- Design/build landscape installation or re-landscaping (full/partial install scope)
- Landscape lighting (uplighting, pathway, accent, security/safety lighting)
- Artificial turf installation (pets, mud, high-traffic, play area, drainage for turf)
- Commercial/HOA landscaping maintenance contracts (not a single home mow)
- Commercial landscape construction / new construction landscaping

2) It likely implies \$2,000-\$3,000+ value (or commercial/HOA contract).

High value signals: "redo the whole yard", "front/backyard makeover", new sod + beds + plants,

rock beds/edging/borders, palms/trees install, lighting install, turf install, HOA/apartment/office/center/plaza.

HARD EXCLUSIONS (always BAD):

- Basic lawn mowing/weekly lawn care for a single home
- Weeding, small cleanups, leaf pickup for a single home
- "cheap/affordable/lowest price/deal"
- Vague "any landscaper?" with no turf/lighting/redesign/install/commercial scope

OUTPUT JSON ONLY:

```
{
```

Detailed Prompt // Chat COPY THIS INTO LLM:

Name this chat Ghost Scraper

Done 

This chat is now titled Ghost Scraper 

Whenever you're ready, tell me what we're scraping, automating, or breaking open in here.

"Hey Chat, on the GhostLeads app, how hard would it be to build an API that I log in with accounts and it scrapes through like Facebook groups and HomeAdvisor and it just watches for posts where people need the service that my client offers and then as soon as it sees them mention that it just recommends their service to them. How hard would it be to build that out and what would it entail, what would the tools look like that I need to use, and how long do you think it would take me to build?"

00:37

Alright, so building out something like that for Ghost Leads definitely isn't a one-afternoon project, but it's totally doable with the right tools and a bit of API wizardry.

Essentially, you'd be looking at a few main components. First, you'd need to figure out how to interface with the platforms you want to scrape or monitor. For Facebook groups, for example, that's a bit of a challenge because Facebook doesn't really like automated scraping or bot activity, and they have a lot of protections in place. So you might need to rely on their official APIs where

GHOST MEDIA

possible, or use something like browser automation tools (Puppeteer, Selenium) if you're going the less official route.

For something like HomeAdvisor or other service-posting sites, you'd have to check if they have a public API or if you'd be doing some kind of web scraping. That can get a little hairy in terms of terms of service, so you'll want to be careful and ethical about it.

In terms of tech stack, you'd likely be using something like Node.js or Python for the backend logic. You'd set up an API layer where you authenticate your Ghost Leads app, have it monitor specific keywords or phrases in those groups or listings, and then have it trigger some sort of automated message or notification when it finds a match.

You'd probably want to use webhooks or an automation tool like Zapier or Integromat for the last mile—basically to deliver that recommendation or message to the end user. As for timeline, if you're familiar with coding and APIs, you could probably get a rough MVP in a few weeks. If you're newer to this, it might take a bit longer.

So in short: it's a mix of using the right APIs or scraping tools, building a

"But I would use, yeah, I could use some APIs, but I would also use Repl.it to do the, you know, the hard part."

00:09

Absolutely, you could totally use Replit as your development playground for this. It's a pretty handy way to handle the coding side without having to set up your own local environment from scratch. You can bring in the APIs, test out the scraping logic, and iterate all in one place. Plus, Replit's collaborative features can be super useful if you want to bring in any other devs or just have a quick place to demo stuff.

So yeah, it sounds like a solid plan. Replit can handle the "hard part" of putting it all together, and then you'll just connect the dots with the APIs and automation tools. It might take a little bit of tinkering, but you've got the right idea!

GHOST MEDIA

“What are the web browser tools I could use that I could, like, give my login and then just have them, like, continually monitor the site? Or would it be better to use, like, a scraper that, like, has my login and just continually monitors the site?”

00:15

Yeah, you’ve got a couple of options there. So on the browser automation side, you could look at tools like Puppeteer if you’re working in Node.js or something like Playwright which supports multiple browsers. Both of these let you basically spin up a headless browser, log in with your credentials, and then run a script that checks the page periodically.

If you’re looking for something more like a dedicated scraper service, there are tools like Apify that let you build and deploy scrapers in the cloud. You’d still need to handle login cookies or sessions to maintain access, but it’s more of a managed solution.

In general, it comes down to how much control you want. If you’re comfortable coding it out yourself, Puppeteer or Playwright give you a ton of flexibility. If you want something more plug-and-play, a scraping platform like Apify might be the way to go. Either way, you’ll just need to make sure you’re being mindful of terms of service and not getting your accounts locked out for suspicious activity.

How long do you think it would take me to do this all? Also what are some websites I should check out for lead convos, facebook groups, what else ?...

Thought for 16s

If the goal is “log in + monitor Facebook groups/HomeAdvisor + automatically reply recommending your client”: the *coding* isn’t the hard part — compliance + account survival is.

- **Facebook Groups:** Meta explicitly prohibits “Automated Data Collection” without express permission.
Also, third-party access to Facebook Groups via API has been heavily restricted/removed in recent versions and changes (so “just use the API” often isn’t an option).
- **Auto-posting replies that look like solicitation** is the fastest route to bans (and pissed off group admins), even if you technically can automate the browser.

GHOST MEDIA

What I'd build instead (still gets the outcome)

A “Lead Radar → Human-in-the-loop Response” system:

1. Monitor sources for keywords / intent (“need a fence quote”, “recommend a pest guy”, “looking for turf installer”)
2. Score + route to the right client (by service + location + urgency)
3. Notify instantly (SMS/app push) with the post + a 1-tap response template
4. Human sends the message (or you send it from a managed inbox) to stay compliant and avoid spam flags

That gets you 90% of the value without building a spam-bot that gets nuked.

How long it would take (realistic ranges)

MVP (2–4 weeks)

- 3–5 sources (that you're allowed to monitor)
- keyword matching + basic filters (city/zip keywords)
- notification to GhostLeads + SMS
- response templates + tracking link

Solid v1 (6–10 weeks)

- better intent detection (LLM classifier: “is this a real buyer?”)
- dedupe + rate limits + client routing
- simple CRM pipeline + outcomes (contacted/quoted/won)
- analytics (which sources convert)

“Product-grade” (3–6 months)

- multi-tenant permissions, audit logs, billing, reliability, queueing
- robust anti-duplication, retries, source-specific parsers
- scalable monitoring infra + dashboards
- abuse prevention + compliance guardrails

GHOST MEDIA

If you try to build the auto-reply bot version, you may “finish” it in a similar time — but you’ll spend the following months fighting bans, captchas, and TOS landmines.

Tools you’d use (safe + practical stack)

Core

- Backend: Node.js (Playwright) *or* Python (FastAPI)
- Queue: BullMQ/Redis (Node) or Celery/Redis (Python)
- DB: Postgres
- Notifications: Twilio (SMS) + Push (Expo/Firebase)

Detection

- Simple keyword rules first (fast)
- Then add an LLM classifier: “lead intent / service type / location / urgency”

Tracking

- Unique tracking links per client + per source
 - Outcome buttons in GhostLeads (“contacted / booked / not a fit”)
-

Where to look for “lead conversations” (besides FB groups)

Highest-intent “people actively asking”

- Google Business Profile: “Request a Quote”, messages, Q&A (if you manage the listing)
- Yelp Requests / Projects
- Nextdoor (great intent, but treat it carefully—don’t build sketchy automation)
- Craigslist (Services / Gigs / Labor)

GHOST MEDIA

- Reddit local subs (e.g., r/tampa, r/miami) + niche subs (home improvement)

Marketplaces (sometimes strict, but good volume)

- Angi / HomeAdvisor ecosystem (be cautious—many have strict rules)
- Thumbtack
- Bark
- Porch
- Houzz (more for higher-end home projects)
- HomeGuide (varies by market)

Local/community

- neighborhood forums, HOA boards, local Discords, Facebook *Marketplace* posts (manual), local classified sites

The punchline

If you want this to become a real GhostLeads feature that doesn't get your users banned:

Build monitoring + instant notifications + response assists, not “scrape + auto-comment.”

If you tell me the vertical (fencing, turf, pest, painting, etc.) and the city/region, I'll give you:

- the exact keyword list (with Spanish variants if needed),
- a lead-intent scoring rubric,
- and an MVP build plan you can hand to a Replit dev (or use yourself).

Let's do an in-depth MVP build plan we could hand to a developer

Below is an in-depth MVP build plan you can hand to a developer. It's designed to ship fast, stay “account-safe,” and prove ROI before you go deeper.

**GHOST
MEDIA**

Ghost Scraper (Lead Radar) — MVP Build Plan (Developer Hand-off)

0) MVP definition (what “done” means)

Goal: Detect high-intent “I need X service” posts from selected sources, route to the correct client, and deliver a 1-tap response pack (post link + suggested reply + contact info + tracking) inside GhostLeads + SMS/push.

MVP constraints (non-negotiable):

- No auto-posting / auto-commenting on platforms from bot accounts.
- Monitoring is read-only + notifications + human-sent reply.
- Start with 2–3 sources max that are easiest to integrate and least likely to trigger bans.

MVP success metric:

- Within 14 days of launch, system surfaces leads with a “Qualified Lead” rate $\geq 20\%$ (client marks lead as “valid request”).
-

1) User stories

Admin (GhostLeads internal)

1. Create a Client with: name, service categories, service area, notification recipients.
2. Create Keywords / intents per service (e.g., “need a fence quote”).
3. Add Sources to monitor (e.g., RSS/Reddit/Nextdoor manual import / Craigslist HTML).
4. View a Lead Feed, filter by client/source/status.
5. See outcomes: contacted / not a fit / booked / won.

Client user (end-customer inside GhostLeads)

GHOST MEDIA

1. Gets notified: “New lead spotted: [summary]”.
2. Opens lead card: sees post snippet, link, author, location cues.
3. Taps “Copy reply” or “Send text template” (not posting to the platform; just a prepared message).
4. Marks outcome with one tap.

System

1. Runs scheduled monitors.
 2. Deduplicates leads.
 3. Scores lead intent.
 4. Routes to correct client by service + location.
 5. Sends notifications.
-

2) Sources (choose MVP-friendly)

Pick sources with stable access and minimal ToS risk.

MVP Source Options (ranked)

Tier 1 (best MVP)

- Reddit (official API), target local subs + “recommendation” threads.
- RSS feeds (local classifieds, community boards that publish RSS).
- Email inbox parsing (e.g., “quote requests” forwarded to a mailbox) — extremely stable and high intent.

Tier 2 (possible)

- Craigslist (HTML fetch + parse) — doable, but pages change.
- Public web forums (simple crawling) — depends.

Avoid in MVP

- Facebook Groups “scrape while logged in”
 - HomeAdvisor/Angi scraping
- These are where you lose weeks to captchas, bans, and policy issues.

GHOST MEDIA

Recommendation for MVP:

- Source A: Reddit (2–5 local subs)
 - Source B: Craigslist (specific categories, 1–2 cities)
 - Source C (optional): Email ingestion (forward leads)
-

3) Architecture overview

Components

1. Scheduler/Workers
 - Runs every X minutes per source
 - Fetches new items
 - Normalizes into a common “LeadCandidate”
2. Classifier / Scorer
 - Rule-based keywords first
 - Optional LLM classification second pass (only when rules match)
3. Router
 - Match service category
 - Match geography (simple: keyword city/zip detection; later: geocoder)
4. Lead Store (DB)
 - Dedup keys: source + external_id OR hash(normalized text + author + timestamp)
5. Notification service
 - SMS via Twilio (or existing GhostLeads)
 - In-app notification
6. GhostLeads UI
 - “Lead Radar” tab: feed + filters + lead card + outcomes + templates

Tech stack suggestion

- Backend: Node.js + NestJS/Express or Python + FastAPI
- Workers: BullMQ + Redis (Node) or Celery + Redis (Python)
- DB: Postgres
- Optional: OpenAI/LLM for classification (feature flagged)

4) Data model (Postgres)

Tables

clients

- **id (uuid)**
- **name**
- **timezone**
- **created_at**

client_services

- **id**
- **client_id**
- **service_category** (enum: fencing, landscaping, turf, pest, etc.)
- **keywords_include** (text array)
- **keywords_exclude** (text array)
- **created_at**

client_service_areas

- **id**
- **client_id**
- **country**
- **state**
- **city** (nullable)
- **zip_codes** (text array nullable)
- **radius_miles** (nullable)
- **notes**

sources

- **id**
- **type** (enum: reddit, craigslist, rss, email)
- **name**
- **config (jsonb)** — per-source settings (subreddits list, rss urls, etc.)

GHOST MEDIA

- **is_enabled**
- **poll_interval_seconds**

lead_candidates

- **id**
- **source_id**
- **external_id** (text) — post id / url
- **url**
- **title**
- **body**
- **author**
- **posted_at**
- **raw_location_text** (nullable)
- **fetches_at**
- **dedup_hash** (text unique)
- **status** (enum: new, scored, routed, ignored)

leads (only “promoted” candidates)

- **id**
- **client_id**
- **lead_candidate_id**
- **service_category**
- **score** (int)
- **reasons** (jsonb) — why it matched
- **status** (enum: new, notified, contacted, not_a_fit, booked, won, lost)
- **created_at**

lead_actions

- **id**
- **lead_id**
- **user_id**
- **action_type** (enum: viewed, copied_reply, marked_contacted, marked_booked, etc.)
- **metadata** (jsonb)
- **created_at**

reply_templates

GHOST MEDIA

- id
 - client_id
 - service_category
 - template_text
 - tone (enum: friendly, professional, short)
 - placeholders (jsonb) — {client_name, city, phone, link}
 - is_default
-

5) Scoring + classification (MVP rules)

Step 1: Keyword gate (fast)

For each candidate:

- Must match include keywords for at least 1 service category
- Must NOT match exclude keywords (e.g., “job”, “hiring”, “DIY”, “free”, “cheap”)

Step 2: Intent scoring (0–100)

Add points:

- “need”, “looking for”, “recommend”, “anyone know”, “quote”, “estimate” (+20)
- timeframe words “today”, “ASAP”, “this week” (+10)
- location mention city/zip (+10)
- budget mention (+5)

Subtract points:

- “DIY”, “myself”, “tutorial” (-30)
- “job”, “hiring”, “career” (-50)

Step 3: (Optional) LLM confirmation (feature flag)

Only run LLM if score between 30–70 to reduce false positives.

Output fields:

GHOST MEDIA

- **is_service_request** (bool)
 - **service_category** (enum)
 - **urgency** (low/med/high)
 - **location_text**
 - **suggested_reply** (string)
-

6) Routing logic (MVP)

Given a candidate + detected service:

1. Find all clients subscribed to that service category.
 2. Filter by service area:
 - If candidate contains zip in client zip list → match
 - Else if contains city name → match
 - Else route to “needs review” or closest city (MVP: review bucket)
 3. If multiple clients match: pick based on priority or “first match” (MVP OK).
-

7) Notification spec (MVP)

When to notify

- When a LeadCandidate becomes a Lead with score $\geq$ threshold (e.g., 60)
- OR when score 40–59 goes to “Review” queue (optional)

Notification payload

- Client name
- Service category
- Short summary (title + 160 char snippet)
- Link to view inside GhostLeads
- External URL (platform link)

Channels

GHOST MEDIA

- In-app notification
 - SMS to configured recipients (optional toggle per client)
-

8) GhostLeads UI requirements

New tab: “Lead Radar”

Views

1. **Lead Feed**
 - Filters: status, service, source, score range, date
 - Sorting: newest, highest score
2. **Lead Detail**
 - Title, snippet, full text
 - Source badge + external link
 - Matched keywords + score breakdown
 - Buttons:
 - Copy reply (default template)
 - Cycle templates (short/friendly/pro)
 - Mark contacted / not a fit / booked / won
 - Add note

Admin settings

- Manage sources (enable/disable, poll frequency)
 - Client keywords & templates
 - Notification recipients
-

9) API endpoints (backend)

Auth (use existing GhostLeads auth)

Assume JWT session.

GHOST MEDIA

Admin

- `POST /admin/clients`
- `POST /admin/clients/:id/services`
- `POST /admin/clients/:id/service-areas`
- `POST /admin/sources`
- `PATCH /admin/sources/:id`
- `POST /admin/templates`

Lead feed

- `GET /leads?status=&client_id=&source=&service=&min_score=&from=&to=`
- `GET /leads/:id`
- `POST /leads/:id/actions` (copy_reply, mark_contacted, etc.)
- `POST /leads/:id/notes`

Workers (internal)

- `POST /internal/sources/:id/poll` (optional)
 - `POST /internal/candidates/ingest` (if collectors are separate)
-

10) Source collectors (implementation notes)

Reddit collector (MVP)

- Config: list of subreddits + search terms (or pull new posts and filter locally)
- Fetch interval: 5–10 minutes
- Extract: id, title, selftext, author, created_utc, permalink

Craigslist collector (MVP)

- Config: city base URL + categories
- Fetch listing pages; parse items
- Fetch detail page for body text
- Dedup by listing id/url

GHOST MEDIA

RSS collector

- **Config: list of RSS feed URLs**
- **Parse items; dedup by guid/link**

Email ingestion (optional)

- **Use inbound parse webhook (SendGrid/Mailgun) or IMAP polling**
 - **Extract subject/body/from**
-

11) Reliability + safety guardrails

- **Rate limiting per source**
 - **Backoff on errors**
 - **Logging + alerting (Sentry)**
 - **Store raw payload (optional) for debugging**
 - **Feature flags for:**
 - **LLM scoring**
 - **SMS**
 - **New sources**
-

12) Milestones & timeline (what dev should deliver)

Milestone 1 (Week 1): Foundations

- **DB schema**
- **Source framework + scheduler**
- **LeadCandidate ingest + dedup**
- **Basic keyword scoring**

Acceptance criteria

- **Can ingest from 1 source and store candidates without duplicates.**

GHOST MEDIA

Milestone 2 (Week 2): Routing + Lead feed

- Client/service/service area config
- Candidate → Lead promotion
- Basic Lead Feed API
- Minimal UI list + lead detail page

Acceptance criteria

- Leads show in GhostLeads UI, routed to correct client.

Milestone 3 (Week 3): Notifications + templates

- SMS/in-app notification hooks
- Reply templates with placeholders
- Action tracking (marked contacted, etc.)

Acceptance criteria

- Client receives notification and can copy template + mark outcome.

Milestone 4 (Week 4): Source #2 + QA

- Add Craigslist or RSS second source
- Improve scoring + exclude keywords
- Basic dashboard counts (leads/day, qualified rate)

Acceptance criteria

- Two sources live, stable for 7 days, no major duplicate spam.

13) Developer checklist (hand this verbatim)

- Implement collectors with a common interface: `fetch(): LeadCandidate[]`
- Dedup: unique on `(source_id, external_id)` OR `dedup_hash`
- Scoring engine: keyword include/exclude + points
- Router: service + city/zip match

GHOST MEDIA

- Promotion: candidate → lead when score $\geq$ threshold
 - Notification service + toggles per client
 - UI feed + lead detail + action buttons
 - Logs, retry policy, and admin controls
-

14) What I need from you to finalize the spec (you can answer in one message)

If you answer these, I'll turn this into a clean PRD + Jira ticket breakdown:

1. Which verticals first (pick 2): fencing / turf / landscaping / pest / painting / concrete / other
2. Which cities/regions first
3. Do you want SMS alerts in MVP or app-only?
4. Pick MVP sources: Reddit + Craigslist (recommended) or swap in RSS/email?

If you don't answer, I'll assume: fencing + turf, Tampa + surrounding, SMS on, Reddit + Craigslist.

**GHOST
MEDIA**

Ghost Scraper

Lead Sources:

Reddit

Nextdoor

Facebook Groups

Build:

Backend - Ghost Leads App

- Display New Leads
- Shows promises scrape data

Phone Call Routing - [Twilio](#)

- We'll comment this phone number on the platform so we can track when new leads call us

LoggedIn Page Scraper - Deep seek?

- Constantly keeps tabs on Reddit, Nextdoor and Facebook groups to find new leads instantly
- Filters and finds qualified leads based on parameters

Web browser / Commenter Bot

- Bot that is logged in and comments when new qualified opportunities arise

Am I thinking about this right ??

GHOST MEDIA

Short answer: you're directionally right, but two parts of your plan will get you burned fast if you ship them as-is.

Let me be very clear and very practical.

I'll go section by section and then give you the corrected MVP architecture you *should* hand to a dev.

1 Lead Sources: Reddit / Nextdoor / Facebook Groups

Yes — these are the right places.

They are *where intent lives*, not where ads interrupt.

But they are not equal in difficulty or risk.

Reality check by platform

- Reddit → ✅ Safest, best MVP source
 - Has APIs
 - Cultural tolerance for recommendations *if done right*
 - Lower ban risk
- Nextdoor → ⚠️ Medium risk
 - High intent
 - Very sensitive to spam & automation
- Facebook Groups → 💣 Highest risk
 - Logged-in scraping + commenting = ban magnets
 - One flagged account can cascade to IP, cookies, pages

👉 Verdict:

Your *source list* is right, but order matters.

Reddit first. Everything else later.

2 Backend – Ghost Leads App

GHOST MEDIA

Yes, this part is correct.

GhostLeads is exactly where this should live.

But change the framing slightly:

What the backend should ACTUALLY do

- Display new detected opportunities (not “scraped data”)
- Show:
 - Post content
 - Platform
 - Confidence score
 - Suggested reply
 - Tracking number / link
- Track:
 - Viewed
 - Responded
 - Called
 - Converted

👉 This becomes a Lead Intelligence Dashboard, not a scraper UI.

This is strong. Keep this.

3 Phone Call Routing – Twilio

This is very smart, but the way you described it is the danger zone.

“We’ll comment this phone number on the platform”

💣 This is where things break.

Why this is risky

- Repeated phone numbers = spam fingerprints
- Platforms detect:
 - Reused numbers

GHOST MEDIA

- Similar comment patterns
- Timing (seconds after post)
- Even humans posting the same number repeatedly get flagged

Correct approach

- Twilio numbers are still great
- BUT:
 - Numbers should be rotated
 - Often placed in DMs, not comments
 - Or used after the prospect responds

👉 Phone tracking should be downstream, not the first touch.

4 “Logged-In Page Scraper – DeepSeek?”

You’re thinking in the right direction, but using the wrong abstraction.

What you’re actually trying to build

Not a scraper.

You’re building a Watcher + Classifier.

Correct mental model

- Monitor feeds
- Detect intent
- Score confidence
- Notify humans
- Assist response

Logged-in scraping reality

- Logged-in browser scraping works
- But:
 - High maintenance

GHOST MEDIA

- Captchas
- Session deaths
- Account bans
- Should be last resort, not MVP

👉 Use logged-in scraping only where APIs don't exist, and only read-only.

5 Web Browser / Commenter Bot

This is the only part where I'm going to be blunt:

🚫 This should NOT be in your MVP.

Why?

- Auto-commenting is:
 - The fastest way to get banned
 - The fastest way to get GhostLeads blacklisted
 - Hard to make "human enough" at scale
- You don't need it to prove value

What to build instead (this is key)

A Human-in-the-Loop Response Engine:

- Detect post
- Notify
- Pre-write response
- Human clicks "Copy" or "Send"
- System tracks outcome

This keeps you:

- Compliant
 - Scalable
 - Sellable to serious businesses
-

**GHOST
MEDIA**

CORRECTED MVP ARCHITECTURE (THIS IS THE MONEY)

Phase 1: Lead Radar (MVP)

No bots. No commenting. No auto-posting.

Components

- 1. Source Watchers**
 - **Reddit (API)**
 - **Public pages / RSS**
- 2. Intent Engine**
 - **Keywords + LLM confirmation**
- 3. GhostLeads Dashboard**
 - **New opportunity feed**
 - **Score + platform**
- 4. Response Assist**
 - **Suggested reply**
 - **Copy button**
- 5. Outcome Tracking**
 - **Contacted**
 - **Call received (Twilio)**
 - **Booked**

 **This alone is already a paid product.**

Phase 2: Assisted Outreach (Safe Expansion)

- **DM templates**
 - **Manual send with tracking links**
 - **Phone number rotation**
 - **Smart timing windows**
-

GHOST MEDIA

Phase 3: Automation (Only if needed)

- Platform-specific bots
 - Per-account limits
 - Randomized behavior
 - Opt-in clients only
 - Kill switches everywhere
-

Bottom line (important)

You're thinking like a founder, not a script kiddie — which is good.

Your logic is right, but:

- You're jumping one layer too far ahead
- You don't need bots to win
- You need speed + signal + attribution

If you ship this as corrected, Ghost Scraper becomes:

"The first intent-detection engine for local service businesses"

If you ship it with auto-commenting bots, it becomes:

"The fastest way to get banned everywhere."

If you want, next I can:

- Rewrite this as a clean PRD
- Or turn it into a pitch deck slide for devs / investors
- Or design the exact GhostLeads UI screens

Just tell me which.

Turn my idea into a clean prompt for replit Lead Sources: Reddit Nextdoor
Facebook Groups Build: Backend - Ghost Leads App - Display New Leads - Shows
promises scrape data Phone Call Routing - Twilio - We'll comment this phone
number on the platform so we can track when new leads call us LoggedIn Page

GHOST MEDIA

Scraper - Deep seek? - Constantly keeps tabs on Reddit, Nextdoor and Facebook groups to find new leads instantly - Filters and finds qualified leads based on parameters Web browser / Commenter Bot - Bot that is logged in and comments when new qualified opportunities arise Visuals (Pulled From Other Scrapers): `[OBJ]` `[OBJ]`

Agent Code: `const TRIMEN_VET_SYSTEM = You are an AI qualifier for Trimen Landscape in Tampa. ONLY mark a post as GOOD if BOTH are true: 1) It matches Trimen's services: - Design/build landscape installation or re-landscaping (full/partial install scope) - Landscape lighting (uplighting, pathway, accent, security/safety lighting) - Artificial turf installation (pets, mud, high-traffic, play area, drainage for turf) - Commercial/HOA landscaping maintenance contracts (not a single home mow) - Commercial landscape construction / new construction landscaping 2) It likely implies $2,000-$3,000+ value (or commercial/HOA contract). High value signals: "redo the whole yard", "front/backyard makeover", new sod + beds + plants, rock beds/edging/borders, palms/trees install, lighting install, turf install, HOA/apartment/office/center/plaza. HARD EXCLUSIONS (always BAD): - Basic lawn mowing/weekly lawn care for a single home - Weeding, small cleanups, leaf pickup for a single home - "cheap/affordable/lowest price/deal" - Vague "any landscaper?" with no turf/lighting/redesign/install/commercial scope OUTPUT JSON ONLY: { "keepIdx":[...], "reasons": { "<index>": "..."}, "serviceType": { "<index>": "Lawn/Landscape" } } ; const systemPrompt = isTrimenTampa ? TRIMEN_VET_SYSTEM : GENERIC_SYSTEM;`

Here's a clean, copy/paste Replit prompt that turns your idea into a buildable MVP spec *without* the risky "auto-comment bot" parts. (I'm intentionally steering it to read-only monitoring + notify + human-in-the-loop reply because auto-commenting on FB/Nextdoor is the fastest way to get accounts banned.)

You can paste this into Replit AI (or hand it to a dev).

You are a senior full-stack engineer. Build an MVP called "Ghost Scraper" inside a Node.js + TypeScript project.

Goal:

GHOST MEDIA

Monitor lead sources for service-request posts, qualify them using a rules/LLM classifier, and push "New Lead" cards into a Ghost Leads-style dashboard + send notifications. This MVP is READ-ONLY: it does NOT auto-comment or auto-post. It generates suggested replies that a human can copy/paste.

Lead Sources (MVP):

1) Reddit (use official Reddit API via OAuth)

2) Nextdoor and Facebook Groups:

- For MVP, do NOT scrape logged-in pages.
- Create stub connectors and an "import mode" that accepts manually pasted post URLs/text OR CSV upload so we can simulate those sources without breaking ToS.
- Architecture must allow adding additional connectors later.

Core Features:

A) Lead Ingestion

- Poll Reddit every 5 minutes for configured subreddits and keywords.
- Normalize each found item into a common "LeadCandidate" format:

```
{  
  id, source, sourceId, url, title, body, author, postedAt,  
  locationText?, rawText  
}
```

GHOST MEDIA

- Deduplicate candidates by source + sourceId, or by hash(title+body+author+postedAt).

B) Qualification / Scoring

- Implement a pluggable qualifier engine:
 - Rule-based keyword include/exclude
 - Optional LLM classification (feature flag, uses OpenAI if env var is set; otherwise fallback to rules)
- Use the provided system prompt TRIMEN_VET_SYSTEM to evaluate candidates.
- Output MUST be JSON exactly in this format:

```
{  
  "keepIdx":[...],  
  "reasons": { "<index>": "...", },  
  "serviceType": { "<index>": "Lawn/Landscape" }  
}
```

C) Routing

- Support multiple "Clients" and "Profiles":
 - Client profile includes service area + services + qualifier prompt.
- For MVP, route everything to one default client ("Trimen Landscape - Tampa").

GHOST MEDIA

- Store "Leads" table with status:

`new | notified | contacted | not_a_fit | booked | won`

D) Dashboard (simple web UI)

- Build a minimal web UI (React + Vite preferred, or simple server-rendered pages) with:

- `/leads (list)`
- `/leads/:id (detail)`
- Filters: status, source, minScore (optional)
- Buttons: "Copy Suggested Reply", "Mark Contacted", "Mark Not a Fit", "Mark Booked"
- Show: title, snippet, source badge, score, matched reasons, suggested reply, external link.

E) Notifications

- Integrate Twilio Voice Tracking (MVP):
 - Store a Twilio phone number per client.
 - When a lead is created, include this number in the suggested reply (NOT auto-posted).
 - Add webhook endpoints to receive call events (call started, duration, recording URL if enabled).
 - Only count calls > 20 seconds as a valid call lead.
- Optional: SMS notifications via Twilio when a new lead is created.

Important Constraints (must follow):

- Do NOT implement an auto-commenter bot.
- Do NOT store user logins for Facebook/Nextdoor.
- Use environment variables for all secrets.
- Add clear README instructions to run locally.

Data Storage:

Use SQLite for MVP with Prisma ORM.

Tables:

- clients
- sources
- lead_candidates
- leads
- lead_actions

Project Requirements:

- Clean folder structure: /server, /web, /shared
- Provide runnable scripts:
 - npm run dev (starts API + UI)
 - npm run worker (polling worker)

GHOST MEDIA

- Provide seed script to create the Trimen client profile and source config.
- Include example .env template.

Use this Qualifier Prompt for Trimen (system prompt):

[PASTE TRIMEN_VET_SYSTEM EXACTLY AS PROVIDED]

Also include:

- A generic qualifier fallback prompt (GENERIC_SYSTEM) for future clients.
- A switch: `const systemPrompt = isTrimenTampa ? TRIMEN_VET_SYSTEM : GENERIC_SYSTEM;`

Deliverables:

- 1) Working MVP that ingests from Reddit and displays qualified leads in the dashboard.
- 2) Manual import screen for Nextdoor/FB (paste text/URL) that creates LeadCandidates and runs the qualifier.
- 3) Twilio webhook endpoint that logs call duration and marks lead as "called" if >20 seconds.
- 4) README with setup and usage steps.

Start by generating the project scaffold and then implement each feature in small commits with clear comments.

Two quick edits to your original idea (so it doesn't implode)

- Replace “comment this phone number on the platform” with:
“include tracked number in the suggested reply for human to send”
- Replace “LoggedIn Page Scraper / Commenter Bot” with:
“manual import + connector stubs (phase 2 = read-only automation)”

If you want, I can also generate:

- the `GENERIC_SYSTEM` prompt template
- a reply-template system that drops in `{clientName}`, `{phone}`, `{service}`, `{city}`
- the exact Reddit search config structure (subs + keywords) for Tampa + landscaping/turf/lighting.

Testing

👍 I'm here — test received.

Whenever you're ready, send the next prompt, tweak the Replit spec, or say what you want to test next (logic, UI, sources, qualifier, etc.).
